**WHAT WE DO**

5G Downlink Media Streaming (5GMSd)

5G Core Network components

Multimedia delivery protocols

MBMS & LTE-based 5G Broadcast

Emergency Alerts over 5G Broadcast

5G Multicast Broadcast Services

XR Media integration in 5G

AI/ML Evaluation Framework

5G-MAG Reference Tools under development

# Some examples under development

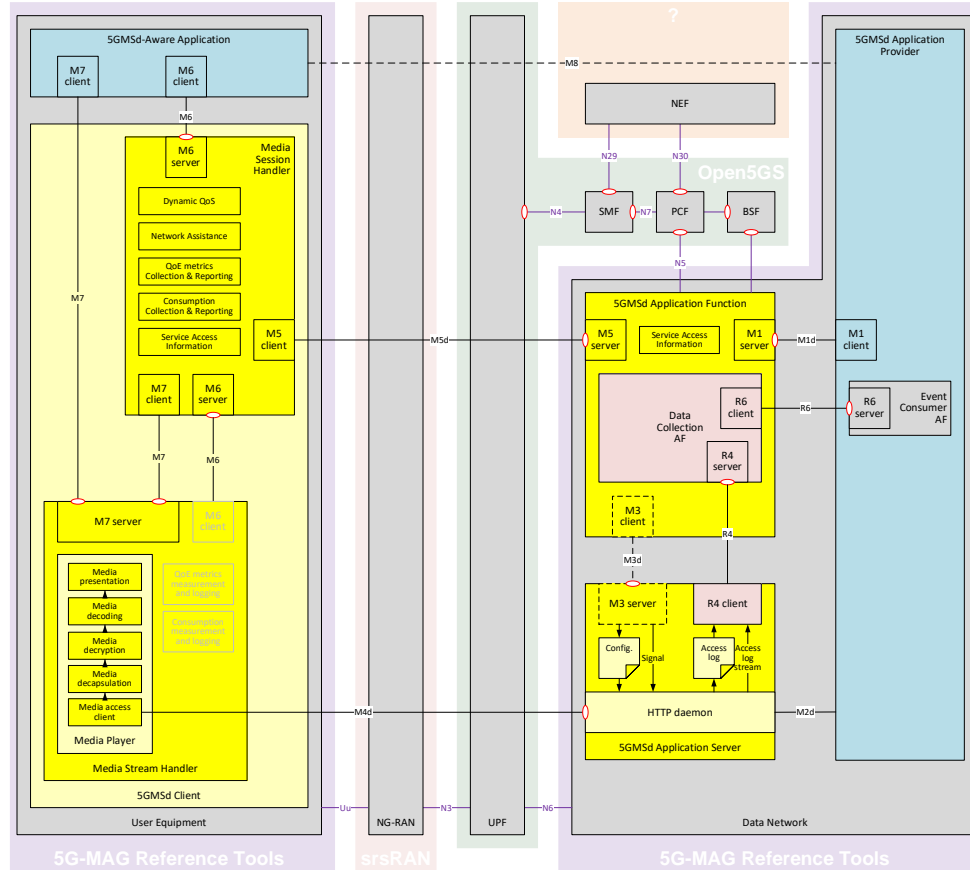

**5G Media Streaming** network components developed so far:

- 5GMS Application Server
  - Wrapping OpenResty (Nginx)
- 5GMS Application Function
  - Built in the Open5GS framework.

**5G Media Streaming Client** components developed so far on Android:

- 5GMS-enabled Media Player
  - Wrapping ExoPlayer.
- Media Session Handler
  - Background service.
- 5GMS-Aware Application
  - App, optionally incorporating the Media Player component.

**5G MAG BRINGING 5G MEDIA STREAMING TO LIFE**  
 5G-MAG DEMO POWERED BY 5G-MAG REFERENCE TOOLS  
 VISIT US AT BOOTH 10.D21 (EBU) DEMO SETUP BY BBC R&D  
 CONTRIBUTIONS FROM: Fraunhofer FOKUS, Qualcomm, Dolby and BBC R&D

5G Media Streaming (5GMS) is a set of technical specifications defined in 3GPP with the aim to achieve better media streaming Quality of Experience by effective collaboration between content providers and mobile networks. Key features under development include:

- Content Hosting
  - CDN deployed inside/outside the mobile network
- Dynamic network QoS policy
  - Automatically tracking representation switching during a streaming session.
- Quality of Experience metrics reporting
  - Supporting non-real-time performance auditing.
- Network Assistance
  - Throughput estimation (bit rate recommendation).
  - Temporary delivery boost.
- Consumption reporting
  - Including exposure of CDN access logs.

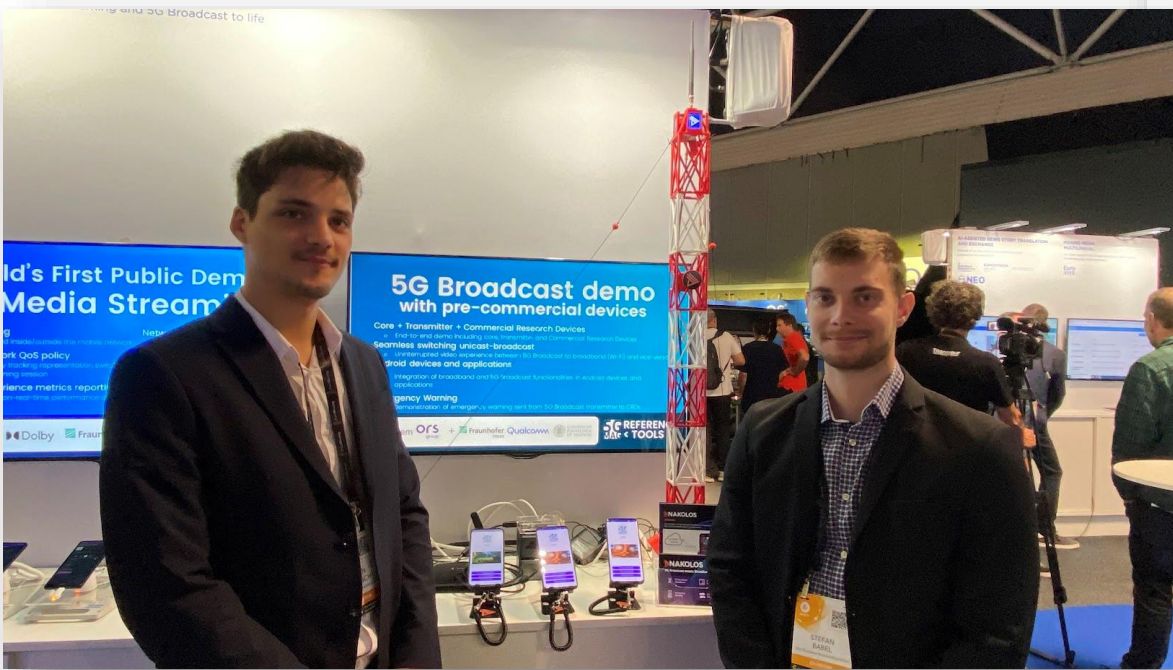

The demo is using some of the 5G-MAG Reference Tools available in our GitHub. In particular the following:

- 5GMS Application Function
- 5GMS Application Server
- 5GMS Media Session Handler
- 5GMS Media Stream Handler
- 5GMS Application
- 5GMS Common Android Library
- 5GC Service Consumers

Note that this demo is partially supported by third-party components (srsRAN gNodeB and Open5GS 5GCore)

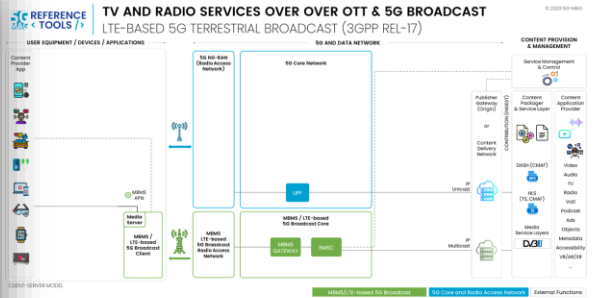

# 5G-MAG Reference Tools @ IBCShow 2023

## BRINGING 5G BROADCAST TO LIFE

5G-MAG DEMO POWERED BY 5G-MAG REFERENCE TOOLS

VISIT US AT BOOTH 10.D21 (EBU) DEMO SETUP BY ORS Group and Bitstem  
CONTRIBUTIONS FROM: Fraunhofer FOKUS, Qualcomm, iTEAM-UPV, ORS Group and Bitstem

LTE-based 5G Broadcast is a set of technical specifications defined in 3GPP to address requirements for broadcasting to mainstream mobile devices. This demonstrator presents the 5G-MAG Reference Tools for 5G Broadcast running on commercial research devices (CRDs). Key features under development include:

- End-to-end demo of 5G Broadcast including 5G Broadcast core, transmitter and CRDs for reception
- Seamless switching between 5G Broadcast and broadband: uninterrupted video experience if the distribution path changes from 5G Broadcast to broadband (Wi-Fi) and vice-versa
- Integration of broadband and 5G Broadcast functionalities in Android devices and applications
- Demonstration of emergency warning sent from 5G Broadcast transmitter to CRDs.

The demo is using some of the 5G-MAG Reference Tools available in our GitHub. In particular the following:

- 5G Broadcast Transmitter for CRD
- MBMS Middleware for Android
- MBMS Middleware
- MBMS Modem
- FLUTE

Note that this demo is partially supported by third-party components (Nakobis 5G Broadcast core and Bitstem 5G Broadcast transmitter) which are not open-source but free to use for 5G-MAG members for tests and demos.

README.md

## Hi, welcome to 5G-MAG's GitHub 🍌

The [5G Media Action Group \(5G-MAG\)](#) (5G-MAG Media Action Group) fosters collaboration between the media and information and communication technology (ICT) industries. A core objective of 5G-MAG is to drive the market-oriented implementation of technologies for the connected media world, leveraging global Internet and 5G access technologies. The work spans from conception of a use case, service or application, up to implementation of proof-of-concepts and products. We aim to be open, agile, pragmatic and instrumental to the industry. Therefore some of our activities are publicly handled within this GitHub.

### 📁 Repos for 5G-MAG REFERENCE TOOLS

GETTING STARTED: <https://github.com/5G-MAG/Getting-Started/wiki>

The 5G-MAG Reference Tools Development Programme is developing the ecosystem of common open software reference tools to support the implementation and interoperability of 5G Media technologies.

Complete information about the development programme can be found at <http://developer.5g-mag.com/> and the 5G-MAG WG Development and Implementation.

### 🔍 Repos for STANDARDS and specifications relevant to 5G-MAG

STANDARDS repo: <https://github.com/5G-MAG/Standards>

5G-MAG maintains a GitHub repository open to the community to provide feedback on specifications, in particular, comments, bug-fixing or request for new features. Complete information can be found at <https://www.5g-mag.com/standards>.

This wiki contains specifications in the scope of 5G-MAG's Areas of Work.

[5G-MAG and 3GPP SA4](#) organize regular joint meetings to discuss issues found on standards. Agenda and Notes are [here](#).

### 📄 Repos for REQUESTS FOR FEEDBACK on 5G-MAG Publications

REQUESTS FOR FEEDBACK repo: <https://github.com/5G-MAG/Requests-for-Feedback>

5G-MAG maintains a GitHub repository open to the community to provide feedback on publications related to 5G-MAG's areas of work. More information can be found at <https://publications.5g-mag.com> and the related 5G-MAG Workgroups.

### 📞 Contact

For general information about 5G-MAG, [send us an e-mail](#). For 5G-MAG Reference Tools, follow the instructions [here](#).

Enjoy! 🍌

## 5GMSd Application Function ([rt-5gms-application-function/releases](#))

- **Release v1.4.0 – 5GMS Application Function**
  - Adds Consumption Reporting, Network Assistance, Dynamic Policies
  - Enhancements: ACME certificate management, Improved validation on API communications, Uplift all interfaces to comply with 3GPP TS 26.512 V17.7.0.
- **From previous releases...**
  - Implementation of the interfaces at reference point M1 for: Provisioning Session (TS 26.512 clauses 4.3.2 & 7.2), Content Protocols Discovery (TS 26.512 clauses 4.3.4 & 7.5), Server Certificates (TS 26.512 clauses 4.3.6 & 7.3), Content Hosting Configuration (TS 26.512 clauses 4.3.3 & 7.6)
  - 5GMS Application Function M3 API

## 5GMSd Application Server ([rt-5gms-application-server/releases](#))

- **Release v1.2.2 – 5GMS Application Server**
  - Adds Consumption Reporting
  - Feature: TS 26.512 v17.7.0 uplift
- **From previous releases...**
  - Add Certificate handling for HTTPS distribution
  - Add M3 interface

## 5GMSd Media Session Handler ([rt-5gms-media-session-handler/releases](#))

- **Release v1.1.0 – 5GMS Media Session Handler**
  - 5GMS Consumption reporting: Add support to Media Session Handler
  - Dispatch information about locationReporting and accessReporting to the Media Stream
- **From previous releases...**
  - Adds a MediaSessionHandlerMessengerService to establish a bidirectional messenger endpoint with the Media Stream Handler.

## 5GMSd Media Stream Handler ([rt-5gms-media-stream-handler/releases](#))

- **Release v1.1.0 – 5GMS Media Stream Handler**
  - Initial support for 5GMS Consumption reporting
  - Add support for location reporting
- **From previous releases...**
  - Adds an ExoPlayerAdapter that implements the M7 interface.

## 5GMSd Application ([rt-5gms-application/releases](#))

- **Release v1.1.0 - 5GMS Application**
  - Request access to ACCESS\_FINE\_LOCATION to support location property when doing consumption reports
  - Request permission for getting GPSI for Consumption Reporting
- **From previous releases...**
  - Visualize the selected bitrate and the selected Representation as an overlay on top of the video
  - Move to Media3 for Exoplayer dependency
  - Adds a user interface to select between different M8 data/endpoints and to select the target stream to be played.
  - Allows for adding new M8 endpoints either via a local .json file or via a server endpoint.
  - Adds a network interface to fetch M8 information
  - **Exo-DVB-I Player:** The Exo DVB-I Player uses the Android ExoPlayer and the DVB-I Reference Client functionality to provide the capabilities to select and play back media content.

## 5GMS Common Android Library ([rt-5gms-common-android-library/releases](#))

- **Release v1.1.0 - 5GMS Common Android Library**
  - 5GMS Consumption reporting: Add support in common Android library
  - Multiple changes related to Consumption Reporting that add required model classes and new Util functions
  - Add new events to be dispatched to enable location reporting
  - Add logic to derive either domain name or the IP address from a request URL

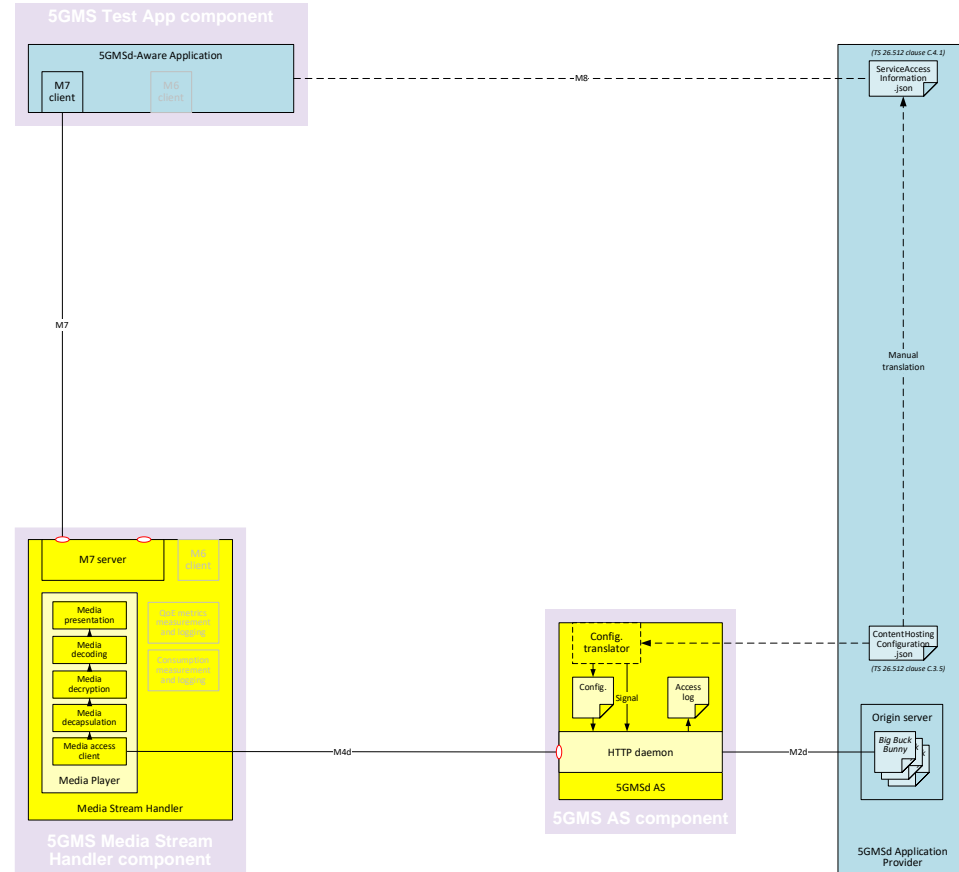

## 5GMS Examples ([rt-5gms-examples/releases](#))

- **Release v1.0.0 - 5GMS Examples**
  - Adds a simple express.js server to mock functionality of the Application Function. The first route m8.js is used to return information about the available services and the available base URL to the Application Function. The 5GMSd Aware Application uses this route as M8 interface. The second route service-access-information.js provides the corresponding ServiceAccessInformation to the data that is returned via M8.

# 5GMS Application Server for MVP#1

- Started with a single static Content Hosting Configuration file (JSON) following the syntax defined in TS 26.512 clause C.3.5.
  - Exposes a virtual host at reference point M4d.
- Changes to HTTP redirect handling by the 5GMS AS have been made recently.

5G-MAG Reference Tools – 5G Media Streaming (downlink) Minimum Viable Product #1  
 <Richard.Bradbury@bbc.co.uk> [9.September.2022]

5GMS:  
Basic media stream handling (MVP#1)

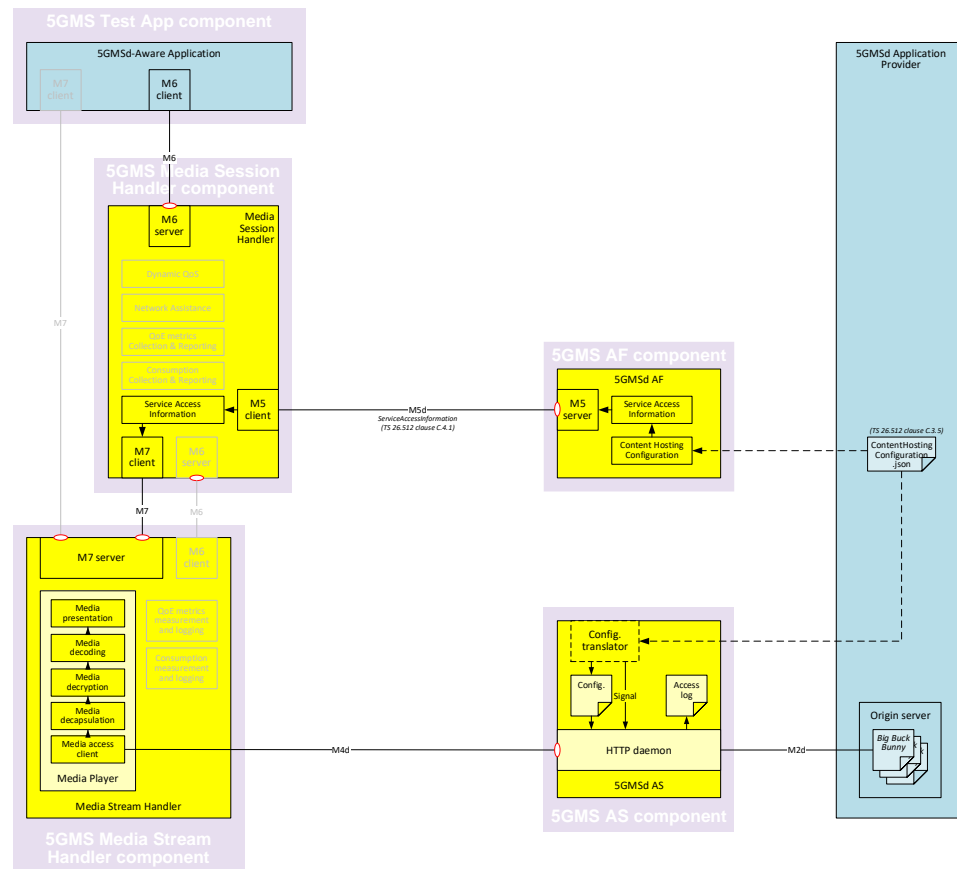

Kanban board

# 5GMS Application Function for MVP#2

- Started with a single static Content Hosting Configuration file (JSON) following the syntax defined in TS 26.512 clause C.3.5.
  - Exposes corresponding **Service Access Information** at M5d.
- No further development work planned on Application Function under MVP#2.

5G-MAG Reference Tools – 5G Media Streaming (downlink) Minimum Viable Product #2

<Richard.Bradbury@bbc.co.uk> [23.August.2022]

5GMS:

Media session handling (MVP#2)

 Kanban board

# 5GMS: M3 link

- AS now configured by the AF and no longer accepts a static Content Hosting Configuration.
  - Model: AS maintains a flat list of server certificates and a flat list of Content Hosting Configurations.
- Initial implementation checked in to AS and AF repositories, including uplift of M3d API to track changes in M1d API as TS 26.512 V17.3.0.
- No further work planned until [Content Publishing Configuration](#) for uplink media streaming is agreed (Release 18).

5G-MAG Reference Tools – 5G Media Streaming (downlink) M3 link  
 <Richard.Bradbury@bbc.co.uk> [5.October.2022]

5GMS:  
 M3 link (AF to AS RESTful OpenAPI)

Kanban board

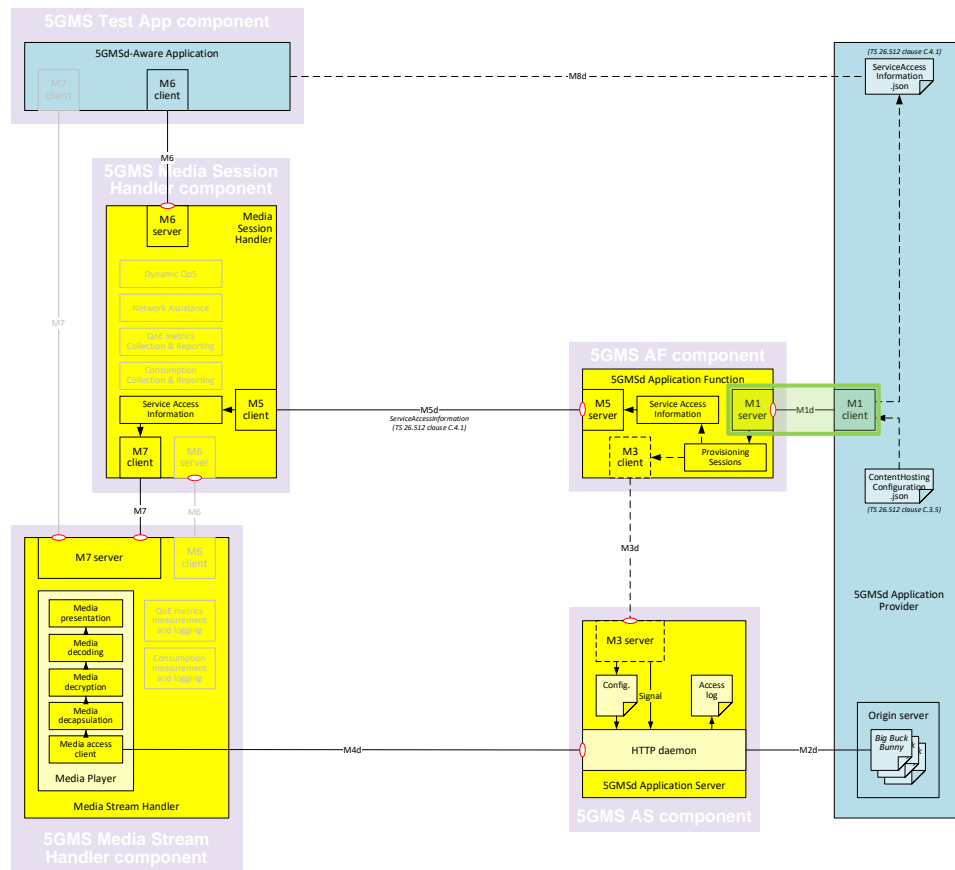

# 5GMS: M1 provisioning

- Application Function now configured via the M1d API and longer accepts a static Content Hosting Configuration.
- Implemented first three APIs at M1d:
  - Provisioning Sessions API.
  - Server Certificates Provisioning API.
  - Content Hosting Provisioning API.
- Uplift to comply with TS 26.512 V17.3.0.
- (Fraunhofer FOKUS currently implementing the Metrics Provisioning API.)
- Next planned development by BBC:
  - Policy Templates Provisioning API.

## 5G-MAG Reference Tools – 5G Media Streaming (downlink) M1 Provisioning

<Richard.Bradbury@bbc.co.uk> [2.December.2022]

5GMS:  
M1d Provisioning

Kanban board

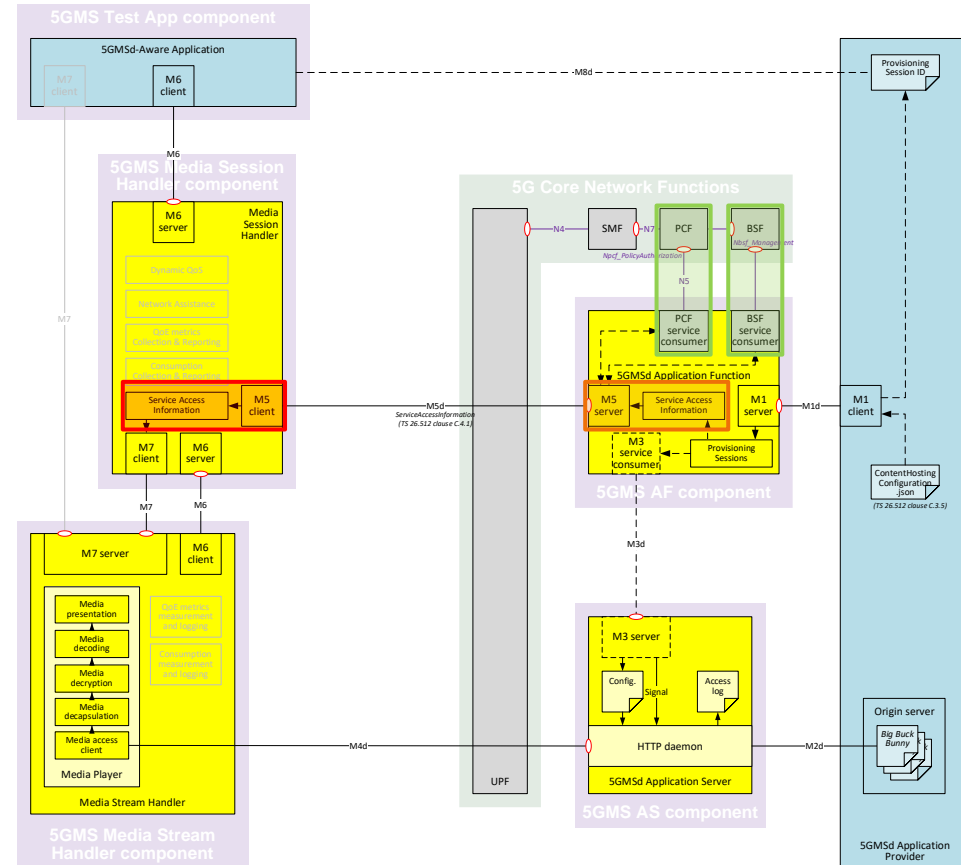

# 5GMS: Network Assistance

- Aiming to support both **delivery boost** and **throughput estimation** (bit rate recomm.).
- Developed new **service consumer libraries** for communicating with the **Binding Support Function (BSF)** and **Policy & Charging Function (PCF)**.
- Integration into 5GMS AF underway:
  - (No M1 provisioning: static configuration only 😊)
  - Additional **Service Access Information** at M5 for use by the Media Session Handler.
  - Implement M5 **Network Assistance API**.
  - (Uplift of 5GMS AF to recently published TS 26.512 V17.5.0 already complete.)
- Additional development of the **Media Session Handler** needed to invoke M5 APIs.

## 5G-MAG Reference Tools – 5G Media Streaming (downlink) PCF Integration

<Richard.Bradbury@bbc.co.uk> [6.July.2023]

**5GMS:**  
[Network Assistance and Dynamic Policies features](#)

Kanban board

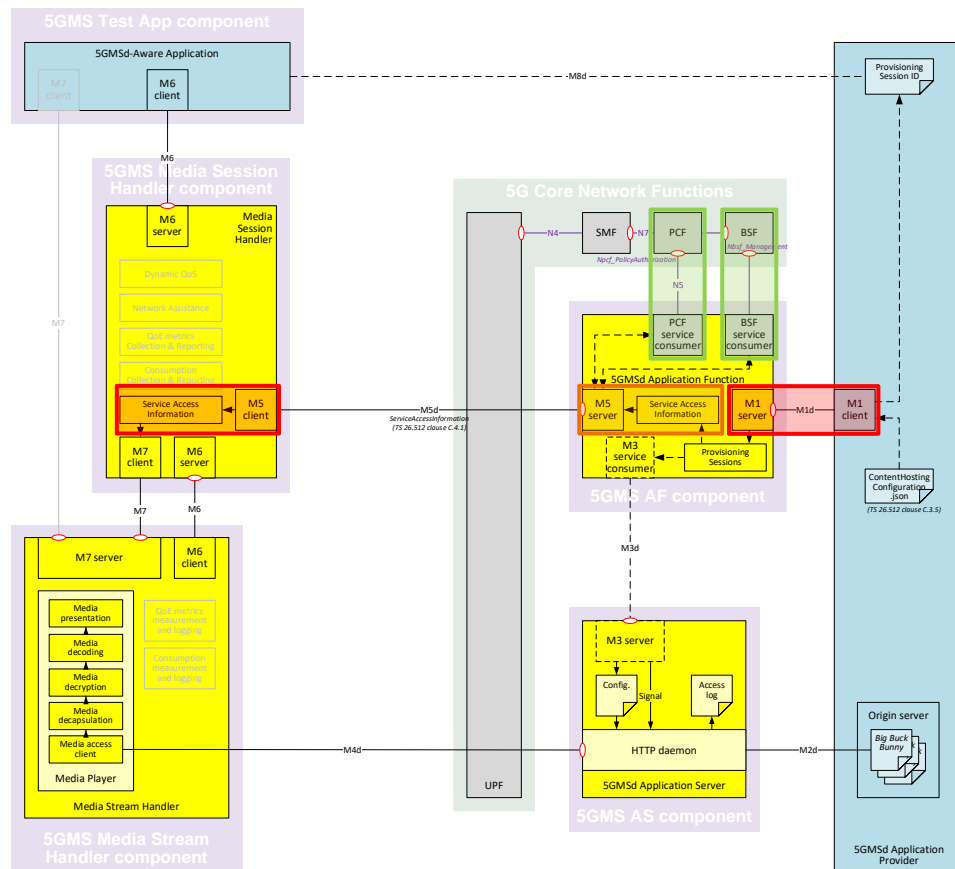

# 5GMS: Dynamic Policies

- Reuse **service consumer libraries** for communicating with the **BSF** and **PCF**.
- Development work in the 5GMS AF:
  - Implement **M1 Policy Templates API**.
  - Additional **Service Access Information** at M5 to support the Media Session Handler.
  - Implement **M5 Dynamic Policies API**.
- Corresponding changes to the **Media Session Handler** needed to invoke these at M5.

## 5G-MAG Reference Tools – 5G Media Streaming (downlink) PCF Integration

<Richard.Bradbury@bbc.co.uk> [6.July.2023]

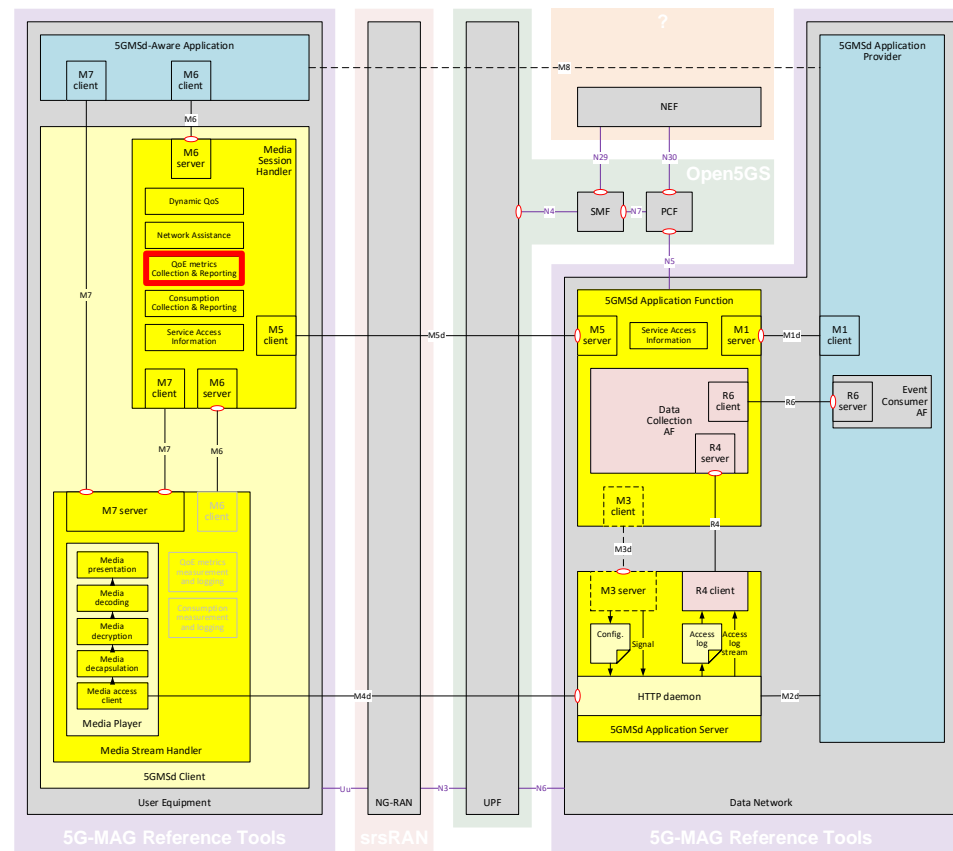

5GMS: [Network Assistance and Dynamic Policies features](#)

Kanban board

# 5GMS: QoE Metrics Collection & Reporting

- Metrics Measurement and Logging Client:
  - Performs the measurement and logging of QoE metrics in accordance with the Metrics Reporting Configuration part of provisioning client data, supplied by the 5GMSd Application Provider to the 5GMSd AF, and forwarded by the 5GMSd AF to the Media Player via the Media Session Handler.
- Initial implementation of QoS metrics and consumption collection and reporting
- Aim to support multiple metric schemes. In particular:
  - For downlink media streaming, TS 26.247 clauses 10.6.1 and 10.6.2 specify the required MIME content type and metrics report format for the 3GPP urn:3GPP:ns:PSS:DASH:QM10 metrics reporting scheme

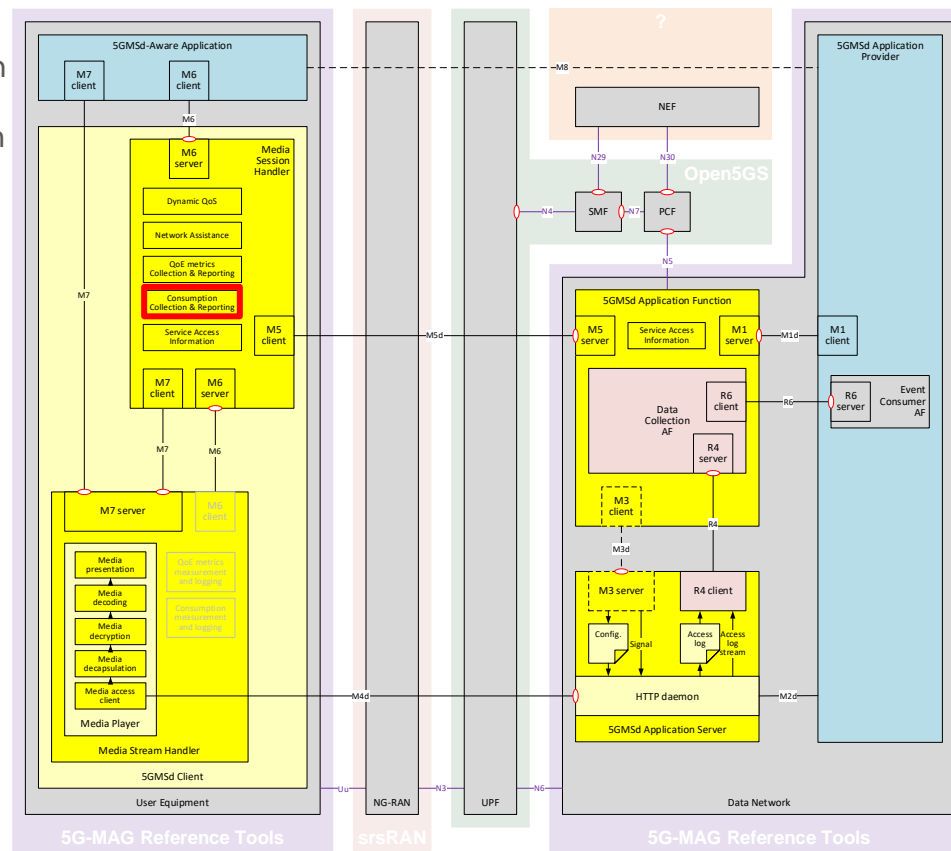

5GMS:

[QoE metrics collection and reporting feature](#)
 Kanban board

# 5GMS: Consumption Collection & Reporting

- Consumption Measurement & Logging Client:
  - Performs the measurement and logging of content consumption-related information in accordance with the Consumption Reporting Configuration part of provisioning data, supplied by the 5GMSd Application Provider to the 5GMSd AF, and forwarded by the 5GMSd AF to the Media Player via the Media Session Handler.
- Initial implementation of **QoS metrics and consumption collection and reporting**
- Aim to support **multiple metric schemes**. In particular:
  - For downlink media streaming, TS 26.247 clauses 10.6.1 and 10.6.2 specify the required MIME content type and metrics report format for the 3GPP urn:3GPP:ns:PSS:DASH:QM10 metrics reporting scheme

## 5GC Service Consumers ([rt-5gc-service-consumers/releases](#))

### ▪ Release v1.0.0 - 5GC Service Consumers

- This is the first release of the 5G Core Service Consumer libraries and tools. These are based upon the Open5GS 5G Core and can be used as an independent set of tools for testing or controlling 5G Core APIs or as libraries for adding API handling into your own Open5GS based AF implementations.
- Initial commit of the Service Consumer libraries and tools
- Service Consumer Libraries: Various bug fixes and improvements

# 5GC: Service consumer libraries & test app

- The 5GMS AF needs to communicate with the 5G Core in order to manipulate **network Quality of Service (QoS)** for ongoing media streaming sessions.
- Solution: *reusable* service consumer libraries to invoke service operations on:
  - Binding Support Function (**BSF**).
  - Policy & Charging Function (**PCF**).
- Could also be exploited by future functions (MBSF, MBSTF, etc.)
- Also developing a command line PCF test application.
  - To test libraries against another 5G Core.

# 5GC: Data Collection, Reporting & Event Exposure

- Exposure of **UE Data** to other **Network Functions** in the 5G System (e.g. NWDAF, third-party AFs,...).
- Implementation of a standalone **Data Collection AF** able to receive generic data reports from the UE and expose them as events to event consumers.
- Implementation in a **shared library** able to be integrated into the 5GMS AF.
- The project complements the client-side collection and reporting for QoE metrics and consumption.

MBMS / LTE-based 5G Terrestrial Broadcast

Protocols for multicast distribution

Auxiliary Functions

- Public release
- Pre-release (members-only)
- Linux
- Android
- Docker
- Cloud
- Dependency
- Code Licence

# Support for FLUTE

- Implementation of FLUTE (File Delivery over Unidirectional Transport) library
  - IETF RFC 6726
  - With FEC Raptor10 support

[MBMS:  
Support for FLUTE](#)

 Kanban board

# Support for ROUTE

- Implementation of ROUTE (Real-time Transport Object delivery over Unidirectional Transport) library to extract a DASH/HLS live filesystem from a ROUTE/IP session
- What it implements at the server side:
  - ROUTE over multicast IP (UDP);
  - Partial segments can be dispatched. Needed for low latency
  - 3 flavours: generic ROUTE (RFC), ATSC3, DVB MABR - updates according <https://www.ietf.org/rfc/rfc9223.html>
  - Not implemented: EXT\_NOP/EXT\_TIME, and optionally EXT\_AUTH if used; Congestion; FEC (RAPTORQ as in RFC 6330)
- What it implements at the client side:
  - 3 flavours: generic (RFC), ATSC3, ATSC3 Korean, DVB MABR - updates <https://www.ietf.org/rfc/rfc9223.html>
  - ROUTE over multicast IP (UDP);
  - Skip repeated files;
  - Low latency;
  - Partially implemented: File repair simple option:
    - MPEG-2 TS: all lost ranges are adjusted to 188-bytes boundaries, and transformed into NULL TS packets.
    - ISOBMFF: all top-level boxes scanned, incomplete boxes are transformed in free boxes, except mdat.
  - Not implemented: Reorder (with timeout); Choose service ID to bootstrap on for ATSC 3.0 mode; FLUTE (as documented in in RFC 3926 and TS 26.346); Congestion; FEC (RAPTORQ as in RFC 6330)

MBMS / LTE-based 5G Terrestrial Broadcast

Protocols for multicast distribution

Auxiliary Functions

- Public release
- Pre-release (members-only)
- Linux
- Android
- Docker
- Cloud
- Dependency
- Code Licence

## LTE-based 5G Broadcast Transmitter ([rt-mbms-tx/releases](#))

- **Release v1.0.0 – LTE-based 5G Broadcast Transmitter**
  - This is the first release of the LTE-based 5G Broadcast Transmitter. This implementation is based on the existing MBMS implementation in [srsRAN\\_4G](#) eNodeB, modified to include a feature set of 3GPP Rel-17 LTE-based 5G Terrestrial Broadcast. It also includes a basic MBMS gateway which creates a virtual network interface `sgi_mb` which receives IP multimedia traffic.

## MBMS Modem ([rt-mbms-modem/releases](#))

- **Release v1.2.1 – MBMS Modem**
  - Enables automatic gain control configuration for the SDR reader via the configuration file
- **From previous releases...**
  - Rebase to srsRAN. Important: This links to the fembms branch of srsRAN: <https://github.com/5G-MAG/srsRAN/branches>
  - Support for MIMO / dual RX streams from BladerF

## MBMS Middleware ([rt-mbms-mw/releases](#))

- **Release v0.10.0 – MBMS Middleware**
  - Add support for seamless switching between broadcast and unicast delivery for HLS streams
  - Add support for three different service announcement formats as document
  - Add support for seamless switching demo via `flute-ffmpeg_watchfolder` approach

## Web User Interface ([rt-wui/releases](#))

- **Release v0.1.0 – Web User Interface**
  - Add support for seamless switching between broadcast and unicast streams for HLS content
  - Update to dash.js 4.4.0
- **From previous releases...**
  - Provide DASH manifest url directly to application.js if available
  - Provide HLS manifest url directly to application.js if available

## MBMS Examples ([rt-mbms-examples/releases](#))

- **Release v0.2 – MBMS Examples**
  - Add support for seamless switching using the `flute ffmpeg watchfolder` approach
- **From previous releases...**
  - Adds an example implementation to demonstrate `rt-mbms-mw` usage without the `rt-mbms-modem` part.

# Under development: What is missing?

## Implemented so far...

- End-to-end support for LTE-based 5G Terrestrial Broadcast
  - Standalone 5G Broadcast transmitter and basic MBMS gateway (Release 14)
  - Standalone 5G Broadcast transmitter for QRDs and CRDs (Rel 9 with Receive-Only Mode capabilities)
  - MBMS Modem/Receiver (Release 17)
  - MBMS Middleware
  - Web User Interface for PHY layer and signaling parameters with integrated player
- Implementation of FLUTE and ROUTE libraries for the MBMS Modem
- Support of DASH, HLS and RTP playback over 5G Broadcast
- Support for seamless switching (only HLS) between unicast and broadcast

## Not implemented and welcome...

- Uplift of 5G Broadcast transmitter to Release 18
- Seamless switching and Android middleware support for DASH
- Further development of MBMS gateway
- Development of BM-SC with xMB interface

# 5G Broadcast SDR-based Modem

- Software-defined radio (SDR)-based modem with support of:
  - Receive-only mode services within a mixed carrier (support of Rel-14 ROM)
  - Receive-only mode services in a dedicated carrier (support of Rel-14, Rel-16 and Rel-17 features)
- Dedicated 5G Broadcast SDR modem implements the following Rel-16 features:
  - Increased CAS robustness
    - PBCH repetition
    - Semi-static CFI in MIB
    - New PDCCH format 4: 16 CCEs / 144 REGs
  - New subcarrier spacings 0.37 kHz, 1.25 kHz and 2.5 kHz
- Dedicated 5G Broadcast SDR modem implements the following Rel-17 features:
  - Support for 6/7/8 MHz MBSFN subframes
- Other improvements:
  - Merged features from all branches (dual-rx, mixed mode, ...) into development
  - Took care of warnings: Now builds clean again with GCC 11.4 at -Wall -Wextra -Wpedantic -Werror
  - Brought srsRAN\_4G up to latest main branch revision from SRS
  - Improved MIB decoding for dedicated cells, was getting confused by MBSFN symbols
  - Speed up startup/synchronisation: SDR is only retuned if parameters have changed
  - Fixed PDSCH resource allocation for 1.4MHz / 6 PRBs

[MBMS:](#)

[MBMS Modem - Rel 17 Support](#)

Kanban board

# 5G Broadcast Transmitters

- Work on two versions of transmitters oriented to:
  - Receive-only mode services within a mixed carrier (support of Rel-14 ROM for CRD/QRDs)
  - Receive-only mode services in a dedicated carrier (support of Rel-14, Rel-16 and Rel-17 features)

[MBMS:  
5G Broadcast Transmitters](#)

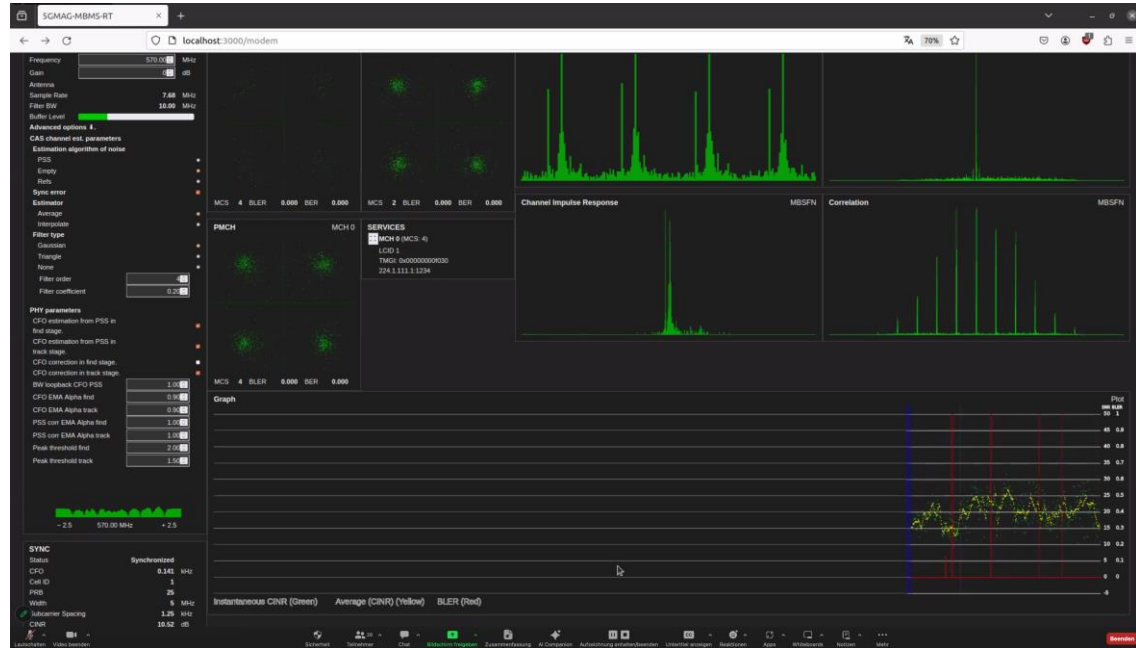

Kanban board

# Web User Interface

## Web User Interface (rt-mbms-wui)

- Interfaces via RESTful API to rt-mbms-modem and rt-mbms-mw
- Useful for checking basic reception parameters
- Middleware file list and service announcement
- Contains HLS and DASH players
- New features added for visualization of advanced parameters

[MBMS:](#)  
[Web User Interface](#)

Kanban board

# 5G Broadcast & Hybrid Unicast–Broadcast

- Seamless switching between broadcast and OTT/unicast content delivery
- Enables flexible usage of bandwidth
  - Broadcast on demand: services can be dynamically provisioned when the demand is there, otherwise viewers are on OTT / using CDN download
  - Off-peak times are freed for e.g. content repositioning / data services
  - Any mix is possible, e.g.
    - 24/7 radio channels with robust coding and SCS 2.5kHz for high mobility
    - 4 TV channels at 1080p / 3 Mbps during the day, but only one at UHD / 12 Mbps for a sports game in the evening
- Mobility scenarios between MBSFN areas: can carry same MBMS service

**Early Access**

Request early access to repositories under development

## Content Playback

- Unity and Unreal Engine 5 are widely used for the creation of 3D experiences
- An open-source XR Player based on Unity Plugins is available (an XR Web Player is expected too)
- Player is able to load at runtime a 3D scene and render it to create an immersive experiences
- Open-source will help developers to get started with standardized technologies and their integration into 5G-MAG

## Content Creation

- Blender is an open-source and widely used 3D authoring tool with native support for glTF
- Extended Blender for authoring Metaverse 3D scenes
- Open-source project to close the loop on content creation/consumption
- Project in has recently been released through 5G-MAG
- Enables developers to create content and ship players that can consume it

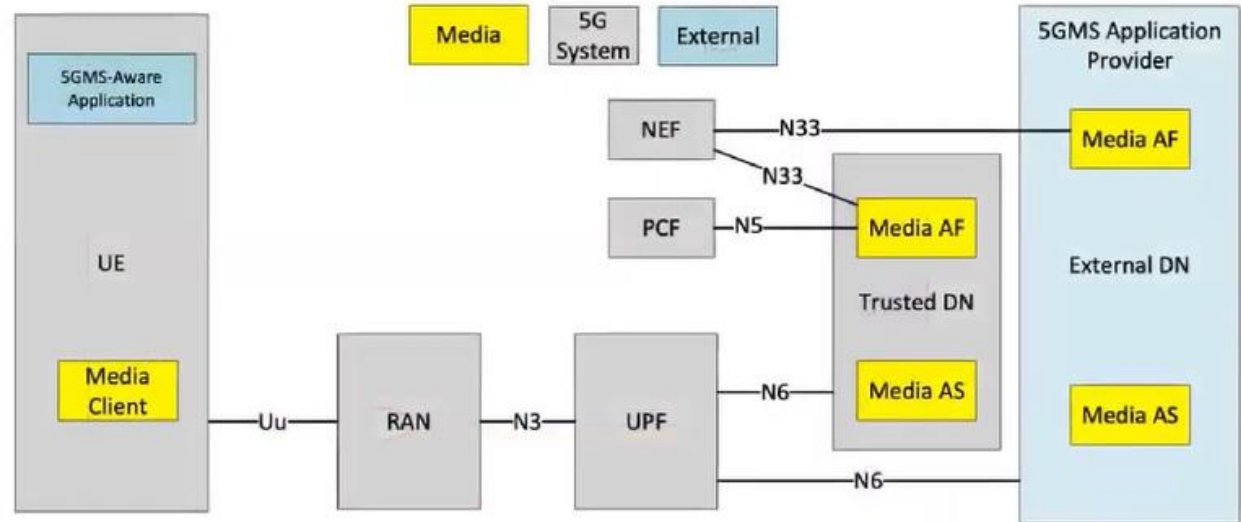

# Under development: XR Media Integration in 5G

- Next steps into integration with 5G
  - Enable QoS supported asset component streaming and download
  - Support both DASH and WebRTC
  - Interface with MSH to request QoS for multiple streams
  - Contributions are solicited

# AI/ML Evaluation Framework

- This project is the implementation of the AI/ML evaluation framework as defined in 3GPP SA4 TR 26.847.
- The purpose is to establish an evaluation framework and use it for the evaluation of scenarios collected for the 3GPP FS\_AI4Media study. This includes the collection of scenarios based on the use cases identified, and defining a scenario template for the description of scenarios for the evaluation.
- The evaluation framework documents common testbed architectures and anchors, metrics (e.g. AI/ML task metrics, feasibility/performance metrics), and specific details (such as test configuration and constraints) for each scenario evaluation.

# REFERENCE < TOOLS />

## Extras for 5G-MAG members

[developer.5g-mag.com](http://developer.5g-mag.com)

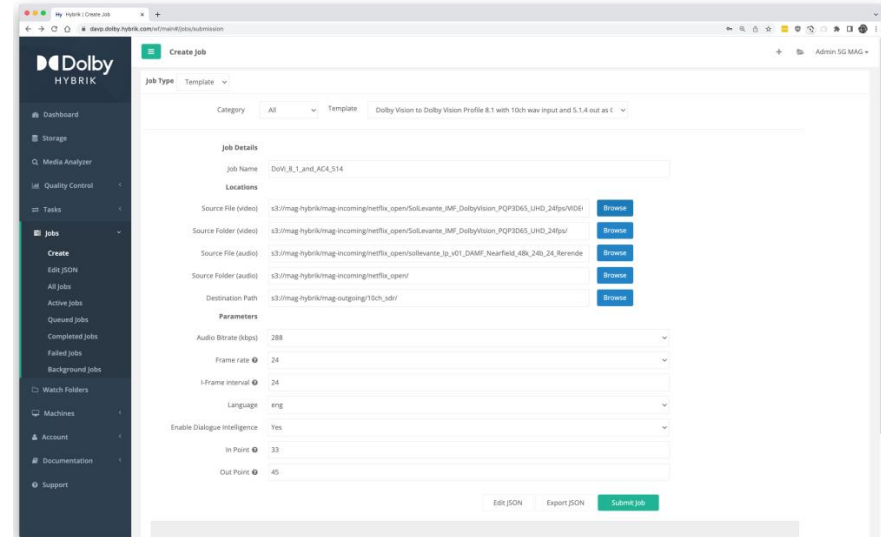

# Encoding service from Dolby Laboratories

THANK  
YOU

- Currently 10 encoding recipes available, reach out if you're looking for something else
- Free cloud-based encoding service for experimentation in scope of 5G-MAG Reference Tools
- Leveraging Dolby's professional infrastructure (Hybrik)
- Best effort and limited support for contributors (no SLA)
- **Free demo and testing licenses are made available by Dolby Laboratories to 5G-MAG members.**
- Please contact Kurt Krauss at [Kurt.Krauss@dolby.com](mailto:Kurt.Krauss@dolby.com)

# 5G Broadcast Modulator from Bitstem

THANK  
YOU

- Supports FeMBMS (3GPP Release 14 up to 18) and eMBMS (Release 9/12 mixed mode for Android prototype handsets CRD/QRD)
- Channel bandwidths 3, 5, 6, 7, 8 and 10 MHz
- Subcarrier spacings ( $\Delta f$ ) of 0.37, 1.25, 2.5, 7.5 and 15 kHz
- Supports ETWS/cell broadcast warning message distribution via SIB12
- RESTful API for configuration, control and status to allow for integration into an existing web interface or configuration system
- Data and control inputs through standardised M1, S1 and M2 interfaces, compatible with 3GPP-compliant 5G Broadcast cores
- Output of modulated I/Q data via Ethernet
- Supports demos and trials through direct ingress of traffic and local configuration, and can output I/Q data via USB directly to BladeRF SDRs
- **Free demo and testing licenses are made available by Bitstem to 5G-MAG members.**
  - Please contact Klaus Kühnhammer at [klaus@bitstem.com](mailto:klaus@bitstem.com)

 **5GM** turns your OFDM transmitter  
into a 5G Broadcast transmitter.

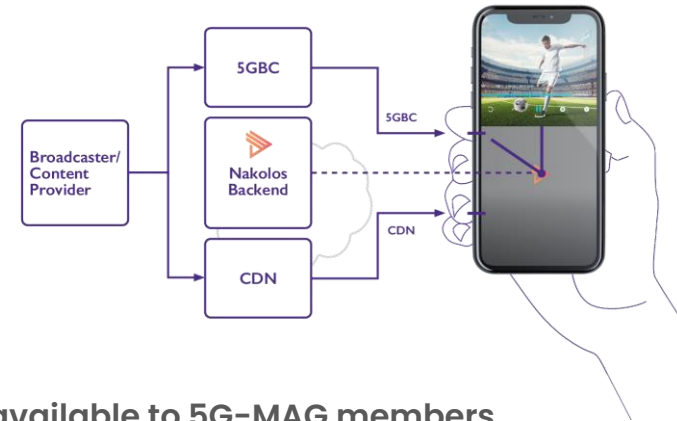

# Nakolos: 5G Broadcast meets Broadband

THANK  
YOU

- Nakolos, a joint-project by ORS Group and Bitstem GmbH develops products and solutions for content providers and broadcast network operators to utilize the combination of 5G Broadcast and Broadband.
- 5G Broadcast Core
  - FeMBMS, LTE-based terrestrial broadcast (3GPP Releases 14, 16, 17), eMBMS (Release 9/12 mixed mode for Android prototype handsets CRD/QRD)
  - Operable in 5G BC standalone or connected mode for broadcast-broadband solutions
  - Runs on-premise or in the cloud
  - Interoperability with different transmitter vendors and emergency warning systems by supporting 3GPP interfaces: xMB, M1, M2, M3, CAP
  - High availability through redundancy on-premise or in the cloud
- 5G Broadcast middleware
  - Standalone app for use-case tests
  - Easy integrable into existing apps for commercial use
- Hybrid connect
  - Broadband load monitoring
  - Dynamic provisioning of 5G Broadcast cores
  - Reports and insights
- **Free demo and testing licenses for the 5G Broadcast core are made available to 5G-MAG members**
  - Please contact Johann Mika at [johann.mika@ors.at](mailto:johann.mika@ors.at) (More info at [www.nakolos.com](http://www.nakolos.com))

## PARTNER FOCUS

### 5G-MAG REFERENCE TOOLS DEVELOPING OPEN SOFTWARE TOOLS FOR 5G MEDIA

By Jordi J. Gimenez (5G-MAG)  
Daniel Silhavy (5G-MAG)  
Johann Mika (5G FOR MEDIA)

5G-MAG has undertaken the duty to bring the 5G Media platform closer to service providers, network operators, developers and users. The 5G-MAG Reference Tools development programme, started in September 2021, has established an open community with the objective of providing common open software reference tools to support the implementation and interoperability of 5G Media technologies. Developers are already implementing core parts of the Release 16 specifications and other related tools. Actually, a toolbox for 5G Broadcast (as defined in the 3GPP standards in Release 16 as LTE-based 5G Terrestrial Broadcast) is already available, including an open-source transmitter, receiver and client components, openly available to the community. With 3GPP Release 17, 5G Media specifications are expanded into the domains of 5G Media Streaming with dynamic

QoS policies, event-explicit Edge applications, and developments towards 5G Media Streaming. Multiple software components are available on GitHub. The license model enables it and demo environments relevant industry players focused on the implement client service layers and by other media services within a dynamic world of apps, software-centric solutions, and agile development. The programme aims at accelerating the ecosystem of open-source reference tools to support 5G media applications.

## Building a suite of open-source tools for 5G-based media services

A growing number of contributors are collaborating to accelerate the software-based ecosystem for media applications. **Daniel Silhavy** (5G-MAG Reference Tools development coordinator) describes the work and

5G-MAG Reference Tools is a development programme that aims to support the creation of new media services within a dynamic world of apps, software-centric solutions, and agile development. The programme aims at accelerating the ecosystem of open-source reference tools to support 5G media applications.

We've already shown this year how broadcast distribution can be integrated within the online and streaming ecosystem. For 2023, we are targeting a further expansion of the tools to optimize the online distribution of media content to 5G devices.

#### FIRST DEMOS

The recent 5G Show in Amsterdam provided an opportunity for 5G-MAG to show the current open-source toolbox in action. The demos shown included OTT streaming and CDN integration over 5G Broadcast with commercial media apps and the dynamic provisioning of services according to availability and user demand. Moreover, taking a step beyond such demonstrations, the tools have also been deployed in live-commercial applications developed by ORS, Bitstream and Fraunhofer FOKUS, active contributors to the 5G-MAG Reference Tools programme.

#### TARGET 2023

Having successfully established the Reference Tools programme, running since late 2021, the focus for 2023 is to expand the tools into new applications. With this in mind, last June we launched Target 2023, a process open to the media and telecom industries, to on-board use cases. It has been instrumental in drawing the picture of what 5G-MAG

## PARTNER FOCUS

### DRIVING SPECIFICATIONS THROUGH 5G-MAG'S OPEN-SOURCE REFERENCE TOOLS

By 5G-MAG

3GPP has progressed and completed the enablers for media services on 3GPP-based systems. However, a reference and conformance programme to validate and prototype the 3GPP specifications and catalyze the adoption was lacking.

As the 3GPP Market Reproduction Partner serving the media industry vertical, the 5G Media Action Group (5G-MAG) has undertaken the task to fill this gap by co-ordinating the creation of a set of open-source implementations of relevant 3GPP technical specifications, which are available freely at [www.5g-mag.com/conference-tools](https://www.5g-mag.com/conference-tools).

5G-MAG Reference Tools is a software-based ecosystem for media applications. **Daniel Silhavy** (5G-MAG Reference Tools development coordinator) describes the work and

#### 3GPP specifications for multimedia applications

3GPP started developing functionalities for multimedia services and applications as part of the Rel-16 and Rel-17 specifications. These include enablers for 5G Media Streaming and extensions such as edge processing, analytics and event exposure. Improvements to LTE-based 5G Broadcast and hybrid services, 5G Multicast Broadcast services (MBS), enhanced reality (AR) and Augmented Reality (AR) experiences, in parallel to this work, 5G-MAG is developing reference software. The 5G-MAG Reference Tools:

- End-to-end MBS and LTE-based 5G Broadcast system with a set of Rel-17 features supported in a cross-layer transmitter, modern and multistandard.
- Analytics implementation of the PLUTE protocol for multicast file transfer.
- Network-side support for over-the-air 5G Media Streaming (OTAS) with:

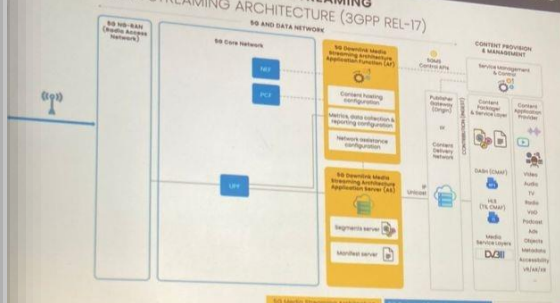

- A reference 5G-MAG Application Function supporting northbound provisioning operations (at reference point M2) and southbound network operations (at reference point M3) to via the User Plane.

5G-MAG Reference Tools is a software-based ecosystem for media applications. **Daniel Silhavy** (5G-MAG Reference Tools development coordinator) describes the work and

- 5G Media Streaming (5GMS) is a set of technical specifications defined in 3GPP with the aim to achieve better media streaming Quality of Experience by effective collaboration between content providers and mobile networks. Key features under development include:
- Content Hosting
    - o CDN deployed inside/outside the mobile network
  - Dynamic network QoS policy
    - o Automatically tracking representation switching during a streaming session.
  - Quality of Experience metrics reporting
    - o Supporting non-real-time performance auditing.
  - Network Assistance
    - o Throughput estimation (bit rate recommendation).
    - o Temporary delivery boost.
  - Consumption reporting
    - o Including exposure of CDN access logs.

Note that this demo is partially supported by third-party components (srsRAN gNodeB and Open5GS 5GCore)

LTE-based 5G Broadcast is a set of technical specifications defined in 3GPP to address requirements for broadcasting to mainstream mobile devices. This demonstrator presents the 5G-MAG Reference Tools for 5G Broadcast running on commercial research devices (CRDs). Key features under development include:

- End-to-end demo of 5G Broadcast including 5G Broadcast core, transmitter and CRDs for reception
- Seamless switching between 5G Broadcast and broadband: uninterrupted video experience if the distribution path changes from 5G Broadcast to broadband (Wi-Fi) and vice-versa
- Integration of broadband and 5G Broadcast functionalities in Android devices and applications
- Demonstration of emergency warning sent from 5G Broadcast transmitter to CRDs.

The demo is using some of the 5G-MAG Reference Tools available in our GitHub. In particular the following:

- 5G Broadcast Transmitter for CRD
- MBMS Middleware for Android
- MBMS Middleware
- MBMS Modem
- FLUTE

Note that this demo is partially supported by third-party components (Nakobis 5G Broadcast core and Bitstern 5G Broadcast transmitter) which are not open-source but free to use for 5G-MAG members for tests and demos.

## 5G-MAG PARTICIPATES IN OSMART WORKSHOPS

The OSMART (Open-Source Media Application Reference Tools) workshop is a regular exchange involving the development of open-source software for media applications with a series of status updates and roadmaps on relevant projects from relevant organizations. Find more information: <https://www.5g-mag.com/osmart> and join the community at <https://github.com/osmart-community/>

# Stay tuned!
