# Introduction

Adding support to Yjs, y-prosemirror and BlockNote for:

- **Suggestions (track changes):** Proposing changes to a document without applying them immediately.
- **Attributions (detailed version history):** Tracking who made what change and when it happened.

Mode: Editing ▾

## Versions &amp; Suggestions Demo

This demo shows how the new versioning and suggestions feature works in Y.js & BlockNote. You'll be able to see features like:

**Version History:** See a document's history, view specific versions, compare changes between documents

- **Create & List:** versions
- **Viewing:** previous versions (compared to their previous version)

**Suggest changes:** edit a document, and all changes are tracked as suggestions to the document (rather than directly writing to the document)

- **Make Suggestions:** Enter a mode where all changes will be recorded as suggestions to the document
- **View Suggestions:** View all suggestions that have been made to the document
- **Accept Changes:** Accept a single suggestion, or accept all changes that have been suggested to the document
- **Reject Changes:** Reject a single suggestion, or reject all changes that have been suggested to the document and even multiple edits

- **Reject Changes:** Reject a single suggestion, or reject all changes that have been suggested to the document and even multiple edits

Make versions

# Anti-pattern: Store suggestions directly

Bad idea, because we want:

## **Decentralized permissions**

Enable suggestion-only users without centrally inspecting every update.

## **Decoupling of versions**

Allow novel collaborative user experiences.

BAD IDEA

Hello

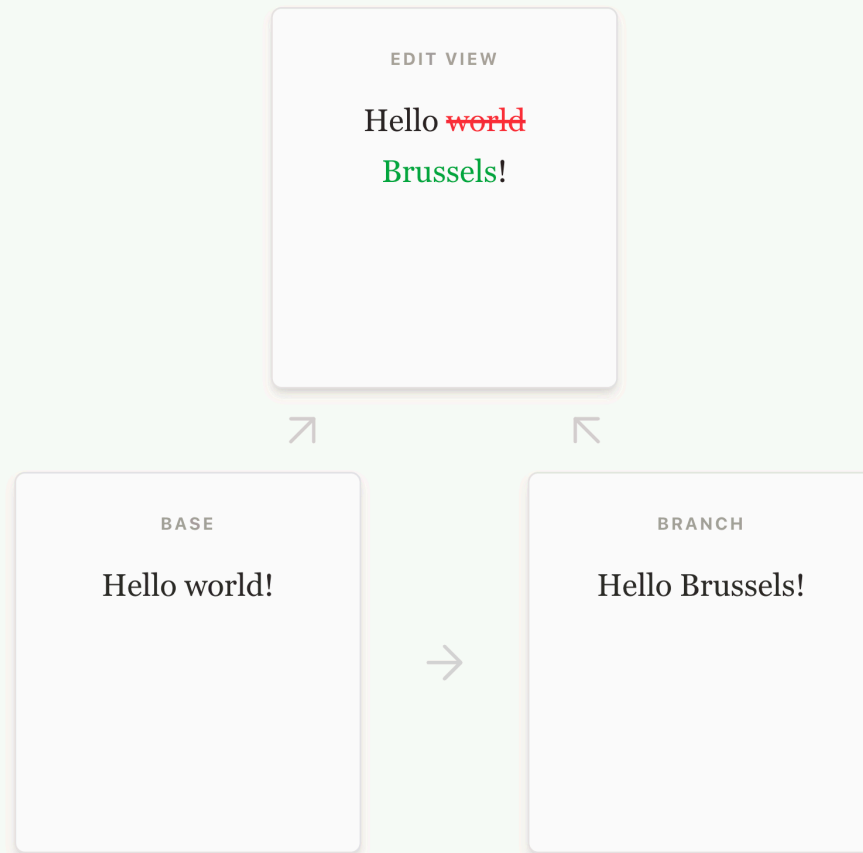

~~world~~

Brussels!

# Solution: model similar to Git branches

Suggestions are like branches, **except:**

- Changes to the base are always shown live in the branch
- Different user modes:
  - **Suggestion mode:** edits go to fork
  - **Edit mode without suggestions:** edits go to base
  - **Edit mode + show suggestions:** edits go to ???

# Attributions: character-level metadata

In Yjs, every character is uniquely addressable. With attributions, we can attach metadata to specific ranges.

- **IDMap<ID, metadata>**: a new data structure that efficiently maps IDs to attributes (metadata).

Metadata can be application-defined:

- Author information
- Timestamps
- Current weather 🌤️

# What's new in Y.js 14

A deep dive into the architectural changes

## Unified Y.Type

One type to rule them all + Schema

## Attribution Manager

Track who wrote what

## Content Renderer

Diffs & attribution display

## @y/prosemirror

The editor bridge, reimaged

An update **6 years** in the making

# Unified Y.Type

## MAPPING TO XML

Y.Text	<code>&lt;&gt;text content&lt;/&gt;</code>
Y.Array	<code>&lt;&gt;&lt;item /&gt;&lt;item /&gt;&lt;/&gt;</code>
Y.Map	<code>&lt;map key="value" /&gt;</code>
Y.XmlElement	<code>&lt;name key="val"&gt;...&lt;/name&gt;</code>

## BEFORE (V13)

## AFTER (V14)

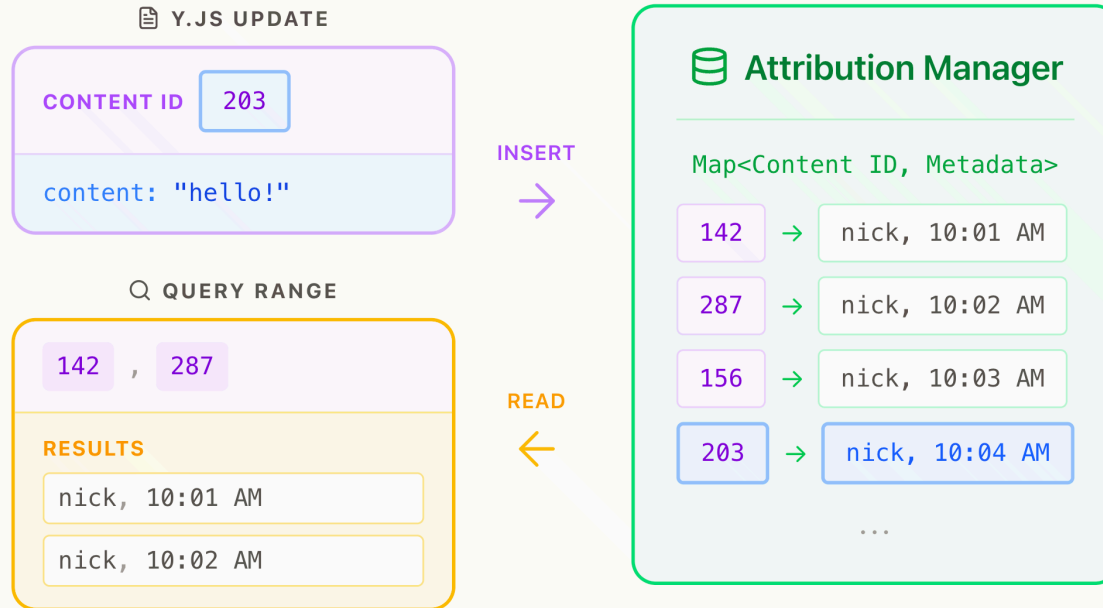

# Deltas: A Universal Change Format

Deltas can...

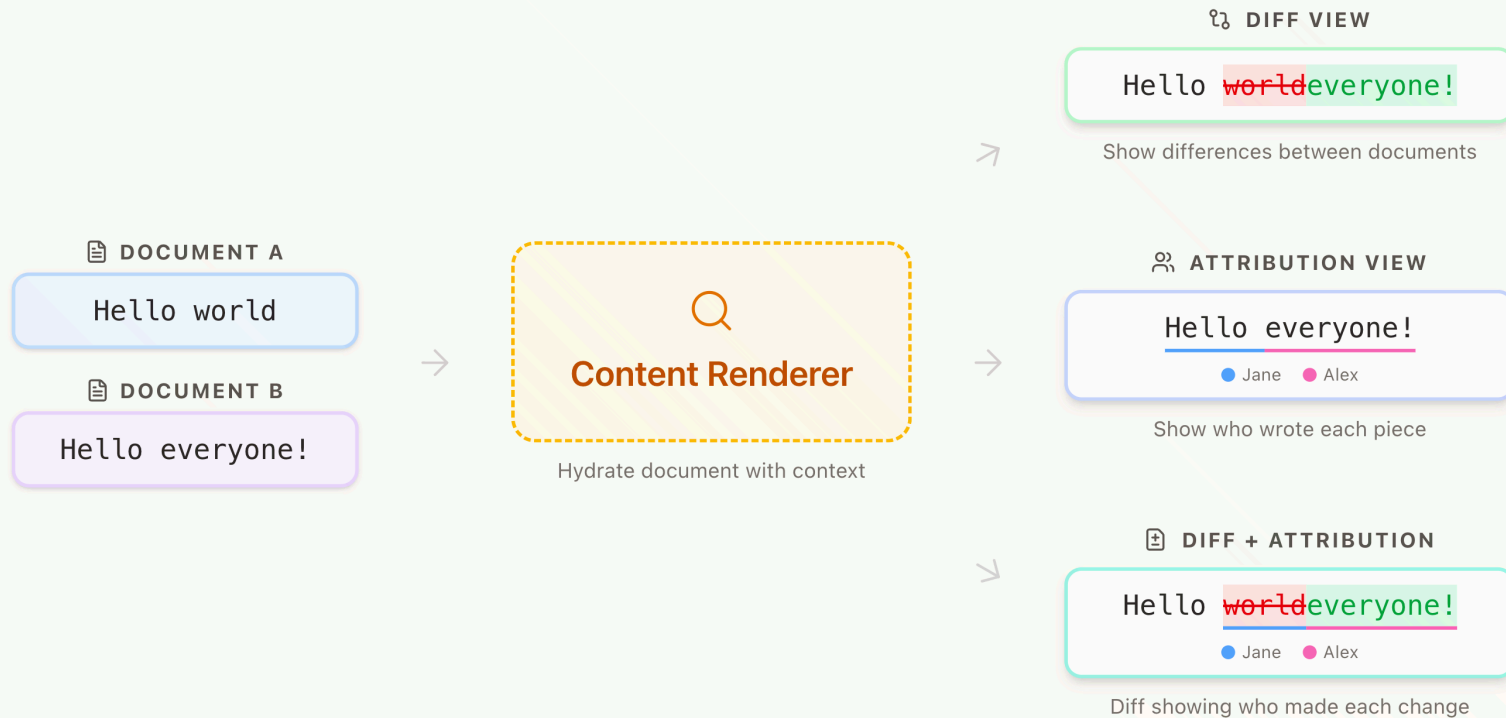

- be diffed
- be merged
- describe changes

# Attribution Manager

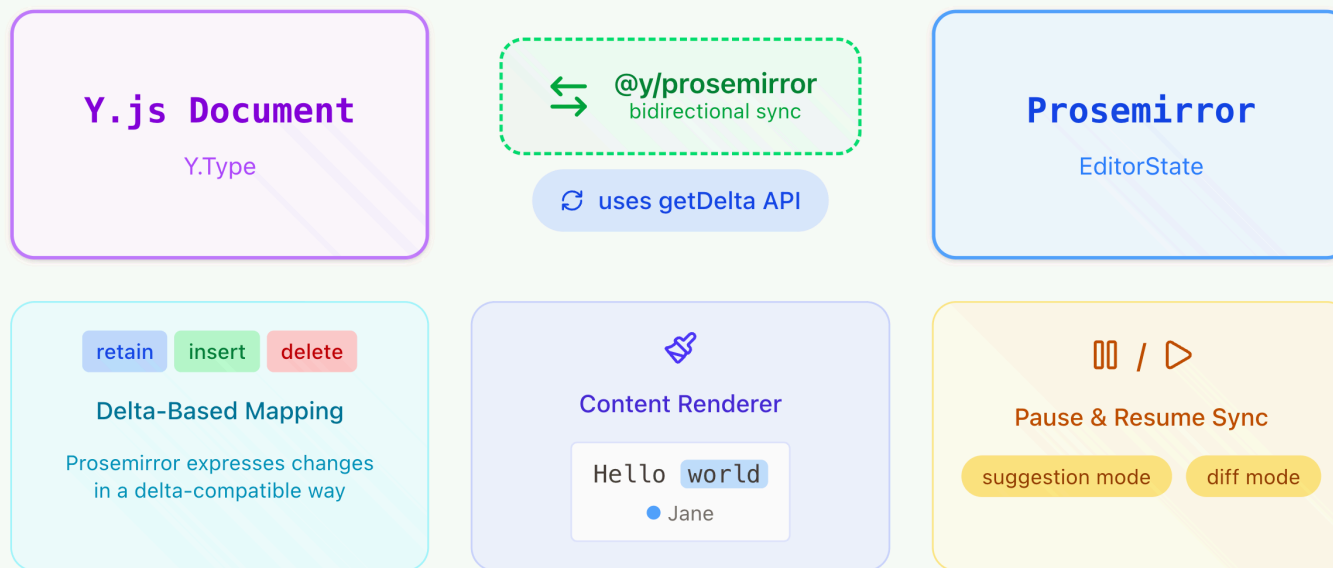

A **Content ID** is a set of inserted and deleted Lamport timestamps that uniquely identify a piece of content

# Content Renderer: Views on documents

# @y/prosemirror: The Bridge

# Thank you!

Yjs 14 preview available under @y/y

y-prosemirror and BlockNote updates later this year
